

Ćw. X. Creating web pages HTML part.4

- 🌐 On previous classes You already created first web page. If you want that someone else to see it, you have to put Your webpage on the Internet.
- 🌐 First, you need to find a place on any web server. In the case of commercial websites it will cost a bit, but thankfully for non-commercial applications are available free servers.
- 🌐 Put your website on the server. Frequently account access via FTP (File Transfer Protocol, if you are a layman it will not interest you what it is).
- 🌐 Now you can view your website using a web browser by typing the web address already (exactly how it will look, you will find the website of the server where you put it).
- 🌐 And if this is your first page, you probably will meet a great disappointment. Links do not work, the page opens slowly, half of the images you can not see 😊
